

Used Parts for Forklifts

Used Parts for Forklift - Without doubt, lift truck parts would eventually wear out and need replacing. The choice of acquiring brand new parts can become expensive so one more idea is to acquire used components. This could save much money in the long run. It is a great idea to buy used lift truck parts that have been reproduced. These components will ensure that you are getting components that will work for a long time and be productive.

Remanufacturing worn out or broken components is a cheaper way in general as opposed to rebuilding. With rebuilding components, only the parts that are broken or worn out get changed, which means that other wearable components could break down soon after acquisition.

Remanufactured parts are cleaned after being taken apart and have the unusable parts replaced. This method can provide the best guarantee for second-hand parts. All wearable parts are replaced regardless of age or wear which is one more rationale why reproduced parts overall perform so much better. Any component within the part is new and this offers much longer life to the second-hand part. Depending on the lift truck parts which are being redone, the cleaning process and the entire remanufacturing process would differ.

The engines are cleaned after a complete disassembly. Several engine components like spark plugs, pistons, rings, valves, valve springs, and filters can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to guarantee that there are no oil pressure problems, no leaks, noises or any vacuum.

Transmissions are disassembled, oven cleaned and pressure washed. A thorough inspection is performed to be able to check for any cracks. Bushings, seals and bearings are all replaced. Normally, the replacement components used on transmission components meet OEM specifications.

Certain forklift parts such as the alternator, the water pump, torque converters, steer axles and the starter could be quite serviceable after worn parts are replaced. The electronic control in the electric forklift is maintained by the control card. This particular card could even be remanufactured with replacing all aged and worn out components. Not like various forklift components the control card can only have the worn and aged components replaced.

Parts which are remanufactured have to be thoroughly examined upon reassembly to ensure they are in good condition prior to being sold. When acquiring these components, it is a good idea to make sure that they have undergone all of the proper testing and inspections. On certain bigger components like for example steer axles, engines and transmissions, OEM specification replacement parts should be used.

The dealer of used lift trucks and components can guarantee that the remanufactured parts have met OEM specifications and that these components meet industry standards. Many details go into remanufacturing second-hand parts. This attention to detail offers more serviceability out of reproduced parts than the parts that were just rebuilt.
