

Grapple for Forklift

Forklift Grapple - Grapples work along with the crowning operation of the bucket cylinder located on the excavator. They could mount directly onto the jib or whichever quick hitch that is in bucket position. Grapples are usually meant for the handling and processing of timber, construction materials, domestic and aggregate waste items. The grapple's boxed design has added support bridging. This manufactured design offers the grapple with maximum support and strength by preventing the body from breaking and turning during its operation.

The grapple and all of its moving parts are made out of hardened steel. The rotating points are designed in order to ensure holding ability and supreme closing force. The one operating it has the capacity to handle different sizes and varieties of materials due to the jaws fitted at the end of the grapple with toes. This enables the jaws to close through one another in a finger configuration for maximum handling capacity.
